

Meridian Continuity Standard

MCS-01-24 · Current edition

Scope

MCS-01 provides the common definitions used when separate divisions review one operating environment. It does not replace specialist methods. It defines the conditions under which those methods can be handed from one discipline to another.

Method

The standard organizes continuity around presence, access, sequence and return. SCR-6 extends this language through position, approach, sequence, atmosphere, persistence and response. Meridian One is the current programme framework through which MCS-01 is applied. MCS-01 revision lineage Edition Change 1987 practice Placement vocabulary established through PCP. 1991 / MCS-01 Common definitions retained across transitional work. 2006 Persistence and review condition introduced. 2016 Cross-divisional handoff and accessibility language added. 2024 Meridian One alignment and SCR-6 references.

Revision history

MCS-01 was not fully formed at its first publication. It is a maintained framework assembled from methods that proved useful beyond their originating division.
